Correspondence e-mail: m.r.j.elsegood@lboro.ac.uk

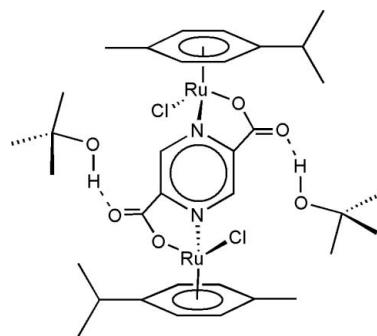

Received 12 December 2007; accepted 3 January 2008

Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(C-C) = 0.007$  Å;  
 $R$  factor = 0.049;  $wR$  factor = 0.115; data-to-parameter ratio = 19.5.

A new *tert*-butanol solvate of  $[(i\text{PrC}_6\text{H}_4\text{Me})\text{RuCl}]_2\{\mu\text{-2,5-pyz}(\text{COO})_2\}$  (pyz = pyrazine) has been crystallized and structurally characterized. The solvate,  $[\text{Ru}_2(\text{C}_{10}\text{H}_{14})_2(\text{C}_6\text{H}_2\text{N}_2\text{O}_4)\text{Cl}_2] \cdot 2\text{C}_4\text{H}_{10}\text{O}$ , contains one half-molecule of the ruthenium(II) complex and one molecule of *tert*-butanol in the asymmetric unit. The complex molecule lies on an inversion centre with the two chlorides *trans*. In contrast, the previously reported structure was solvent-free. Similar metric parameters are found between the butanol solvate and the solvent-free form and an intermolecular O—H···O hydrogen bond exists between  $\mu$ -pyrazine-2,5-dicarboxylato-bis[chlorido( $\eta^6$ -*p*-cymene)ruthenium(II)] and the *tert*-butanol molecule.

## Related literature

The structure of the solvent-free complex has been reported previously (Govindasamy *et al.*, 2007). One molecule adopts a *trans* configuration of the two chloro ligands while the second lies on a twofold axis giving the two chloro ligands a *cis* configuration. For other related literature, see: Cadiero *et al.* (2002); Carter *et al.* (1993); Dann *et al.* (2006); Dorcier *et al.* (2005); Drommi *et al.* (1995); Ganter (2003); Gemel *et al.* (2000); Grote *et al.* (2004); Ion *et al.* (2006); Konar *et al.* (2004); Lahuerta *et al.* (1988); Ma *et al.* (2004); Pinto *et al.* (2004).

## $\mu$ -Pyrazine-2,5-dicarboxylato-bis[chlorido( $\eta^6$ -*p*-cymene)ruthenium(II)] *tert*-butanol solvate

N. M. Sanchez Ballester, M. R. J. Elsegood and M. B. Smith

### Comment

There has been considerable interest in the chemistry of areruthenium(II) complexes for a variety of purposes. These range from their interesting and varied coordination chemistry (Cadierno *et al.*, 2002; Drommi *et al.*, 1995) including DNA binding studies (Dorcier *et al.*, 2005) to applications in areas including supramolecular chemistry, as highly selective receptors and catalysis (Dann *et al.*, 2006; Ganter, 2003; Grote *et al.*, 2004; Ion *et al.*, 2006). These organometallic ruthenium(II) fragments have also been used in the synthesis of chiral half-sandwich compounds (Ganter, 2003; Pinto *et al.*, 2004). Pyrazine polycarboxylic acids are excellent ligands for metal coordination (Konar *et al.*, 2004; Ma *et al.*, 2004). Complexes of ruthenium(II) with pyrazine carboxylic acids are known and their redox behaviour has been studied by voltammetric methods (Govindaswamy *et al.*, 2007). We report here the molecular structure of a new *tert*-butanol solvate of the ruthenium(II) complex  $[(\{\eta^6-p-i\text{PrC}_6\text{H}_4\text{Me}\})\text{RuCl}]_2\{\mu\text{-}2,5\text{-pyz}(\text{COO})_2\}$ .  $^t\text{BuOH}$  **1**. The solvent free structure, **2**, which contains one molecule with a *trans* configuration of the two chloro ligands and a second molecule with twofold symmetry that has two chloro ligands disposed in a *cis* configuration, has recently been reported (Govindaswamy *et al.*, 2007).

The molecular structure of **1** is shown in Figure 1 and shows a typical piano-stool geometry at each ruthenium(II) centre with each metal bonded to an  $\eta^6$ -*p*-*i*PrC<sub>6</sub>H<sub>4</sub>Me arene [Ru—C<sub>centroid</sub> 1.6689 (16) Å], a terminal chloride and a dianionic *N,O*-chelating pyrazine ligand. The Ru—Cl bond length in **1** [2.3975 (11) Å] is slightly shorter than that in the *trans* isomer [2.408 (5) Å] of **2** yet similar to the *cis* isomer [2.388 (3) Å, 2.399 (3) Å]. The Ru—O and Ru—N bond distances in **1** [2.099 (3) Å and 2.097 (3) Å respectively] are similar to those in the *cis* isomer of **2** [2.083 (10)/2.109 (9) Å and 2.102 (7)/2.074 (7) Å respectively] and with those of other related three-legged piano-stool ruthenium(II) complexes (Carter *et al.*, 1993; Gemel *et al.*, 2000; Lahuerta *et al.*, 1988). The N(1)—Ru(1)—O(2) bite angle in **1** [77.29 (12) $^\circ$ ] is broadly as expected for this type of five-membered chelating ligand. The  $\eta^6$ -*p*-*i*PrC<sub>6</sub>H<sub>4</sub>Me arene ring is essentially planar with C—C bond lengths in the range 1.392 (6)–1.435 (6) Å. The Ru complex is hydrogen-bonded to a  $^t\text{BuOH}$  molecule through a strong intermolecular O—H···O interaction.

In summary, we have reported the crystal structure of a new *tert*-butanol solvate form of  $[(\{\eta^6-p-i\text{PrC}_6\text{H}_4\text{Me}\})\text{RuCl}]_2\{\mu\text{-}2,5\text{-pyz}(\text{COO})_2\}$  **1** that displays very similar bond lengths and angles around the ruthenium(II) coordination sphere to complex **2** recently published (Govindaswamy *et al.*, 2007).

### Experimental

Crystals of compound **1** were obtained unexpectedly from the experimental procedure outlined here. Boronic acid (0.004 g, 0.007 mmol) in warm  $^t\text{BuOH}$  (10 ml) was added dropwise to a solution of  $[(\{\eta^6-p-i\text{PrC}_6\text{H}_4\text{Me}\})\text{RuCl}]_2\{\mu\text{-}2,5\text{-pyz}(\text{COO})_2\}$  (0.023 g, 0.0325 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (10 ml) affording an orange-red solution. The solution was stirred at room temperature

# supplementary materials

for 3 h and the volume was concentrated to 2–3 ml. Suitable X-ray quality crystals of **1** were obtained by slow vapour diffusion of diethyl ether into the concentrated  $\text{CH}_2\text{Cl}_2/t\text{BuOH}$  solution.

## Refinement

H atoms were placed in geometric positions (C—H distance = 0.95 Å for aryl H; 0.98 Å for methine, 1.00 Å for methyl H; and 0.84 Å for O—H) using a riding model.  $U_{\text{iso}}$  values were set to  $1.2U_{\text{eq}}$  (C) ( $1.5U_{\text{eq}}$  (C/O) for methyl H and OH atoms respectively).

## Figures

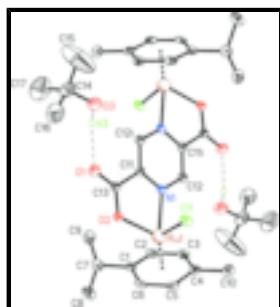

Fig. 1. View of **1**, showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. All H atoms except on O(3) have been removed for clarity. Symmetry operator:  $A = -x, -y, -z$ .

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.049$	H-atom parameters constrained
$wR(F^2) = 0.115$	$w = 1/[\sigma^2(F_o^2) + (0.0329P)^2 + 10.5824P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} = 0.034$
4196 reflections	$\Delta\rho_{\max} = 2.78 \text{ e \AA}^{-3}$
215 parameters	$\Delta\rho_{\min} = -1.04 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
